

Title: LL232S
Product number: LL232S
Brochure Number:
General:

Operation: Some equipment, like printers, needs what's known as a handshake signal before data can be sent to it. The LL232S supports one handshake on pins 4 (RTS Request to send) and 5 (CTS Clear to send) with data Tx/Rx on pins 2/3. This handshake signal is sent to the equipment to which the data is going to be sent, the equipment will then send a signal back to confirm that its ready so that data can be sent.

The LL232S is a media converter that changes the RS232 data signal to an optical signal that is sent through the fibre optic cable as a serial data stream. The receiving LL232S will then convert the high-speed serial data stream back to a RS232 data signal.

Single channel RS232 fibre interface
